ASX Announcement

28 May 2014

Mineral Resource Review of Brightstar Project Western Australia

Stone Resources Australia Limited (Stone) is pleased to announce the completion of a review by CSA Global Pty Ltd (CSA) of its Mineral Resource estimates (MRE), specifically the Alpha, Ben Hur and Delta deposits within the Brightstar Project. The MRE were completed by SKR New Investment Pty Ltd and released to the Australian Stock Exchange (ASX) on the 23rd April 2013. The original MRE were completed in accordance with the 2004 edition of Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves (2004 JORC Code).

CSA reviewed the modelling methods, estimation criteria, resource classification and the MRE results. CSA also conducted a site visit and laboratory inspections.

The review has confirmed that the methods and results of the MRE and the classification of Measured, Indicated and Inferred resources (Table 1) were properly completed. Together with the supplementary work completed by CSA, the MRE results are confirmed to be in compliance with the 2012 edition of Australian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves (2012 JORC Code).

Table 1: Brightstar Project - Mineral Resource Estimate Results for Alpha, Ben Hur and Delta Deposits

| <i>In-situ</i> Mineral Resources Grade Tonnage Reported above a Cut-off Grade of 0.5g/t Au | | | | |
|---|--------------------|--------------------|-------------------|---------------------|
| Deposit | Category | Tonnes (kt) | Grade(g/t) | Ounces (koz) |
| Alpha | Measured | 623 | 1.6 | 33 |
| | Indicated | 374 | 2.1 | 25 |
| | Meas+Ind | 997 | 1.8 | 58 |
| | Inferred (approx.) | 455 | 3.3 | 48 |
| Ben Hur | Measured | 2,434 | 1.6 | 125 |
| | Indicated | 1,672 | 1.4 | 77 |
| | Meas+Ind | 4,105 | 1.5 | 202 |
| | Inferred (approx.) | 1,665 | 1.6 | 87 |
| Delta | Measured | 1,220 | 1.9 | 76 |
| | Indicated | 944 | 1.9 | 57 |
| | Meas+Ind | 2,164 | 1.9 | 133 |
| | Inferred (approx.) | 1,696 | 1.9 | 104 |

Competent Persons Statement

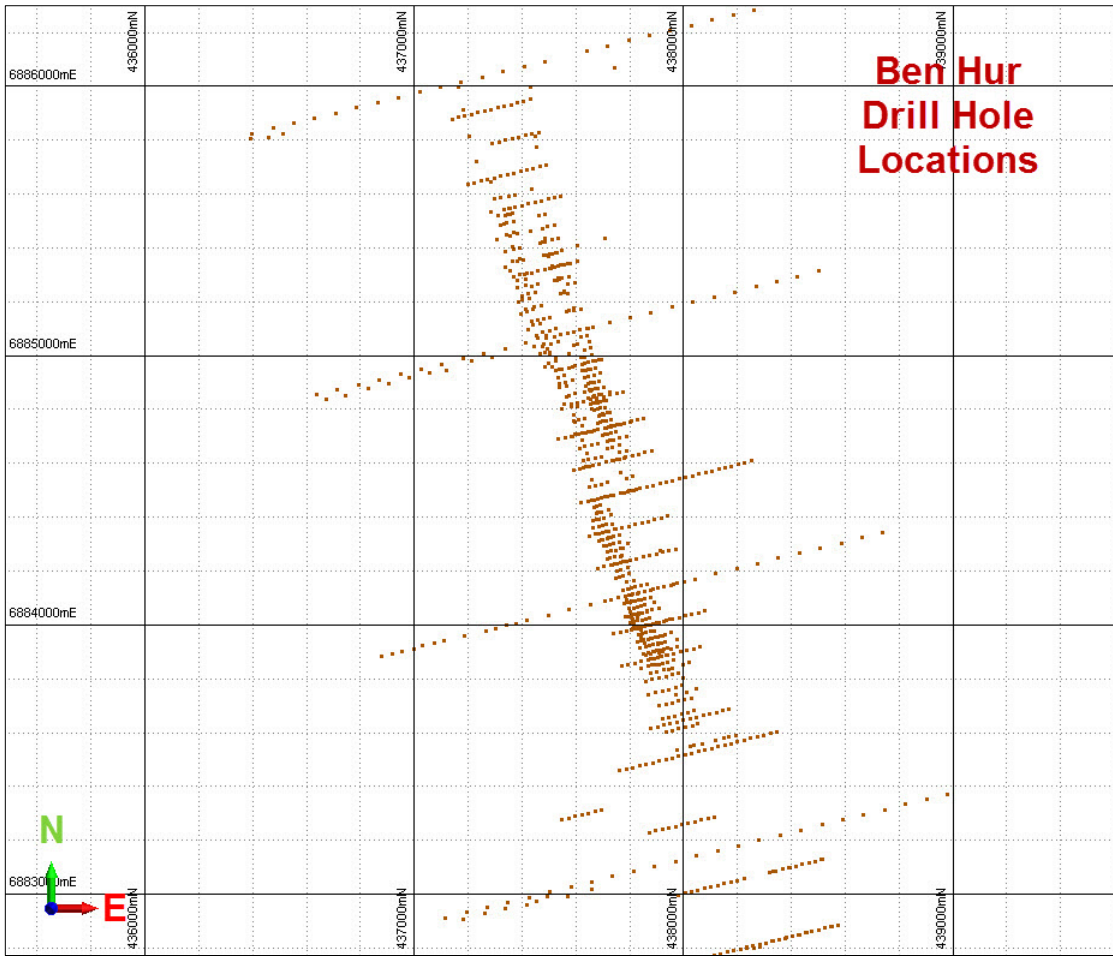

The information in this report that relates to Mineral Resources is based on information compiled by Dr. Bielin Shi, who is a member of the Australasian Institute of Mining and Metallurgy and of the Australian Institute of Geoscientists. Dr. Shi is an employee of CSA Global Pty. Ltd. Dr. Shi has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person (CP) as defined in the 2012 Edition of the Joint Ore Reserves Committee (JORC) "Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves". Dr. Shi consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

Appendix JORC Table 1 Compliance

Section 1 Sampling Techniques and Data

| Criteria | JORC Code explanation | Commentary |
|---------------------|---|---|
| Sampling techniques | <ul style="list-style-type: none"> Nature and quality of sampling (eg cut channels, random chips, or specific specialized industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling. Include reference to measures taken to ensure sample representatively and the appropriate calibration of any measurement tools or systems used. Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information. | <ul style="list-style-type: none"> The Alpha deposit was drilled primarily in a nominal 20m by 20m spacing in areas; a total of 1349 historic RC drill holes, and 46 infill RC drill holes drilled in 2012. The Ben Hur deposit was drilled primarily in a nominal 20m by 20m and 40m by 20m spacing in areas; a total of 929 historic RC drill holes, and 191 infill RC drill holes drilled in 2012. The Delta deposit was drilled primarily in a nominal 20m by 20m and 40m by 20m spacing in areas; a total of the historic RC drill holes, and 75 infill RC drill holes drilled in 2012. The drilling programs in Alpha, Ben Hur and Delta areas were designed to optimally intersect the mineralised zones. Sampling was carried out under Stone's supervision according to its QAQC protocols and procedures. This included the use of field duplicates, commercially prepared blanks and certified reference materials. The orientation of the mineralisation had been determined by mapping and previous diamond and RC drilling. This was confirmed in the latest drilling campaign. Drill core was split to produce samples ranging from 2.5 to 3.5kg in weight. In the assay laboratory the samples were crushed pulverised and subsampled to produce a 50g charge for fire assaying with an AAS finish. This gave a total determination of Au. |
| Drilling techniques | <ul style="list-style-type: none"> Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc). | <ul style="list-style-type: none"> The drilling rig cyclone was regularly cleaned out and flushed at rod changes in RC drilling program. This was to prevent any smearing of grade between 1m sample intervals. |
| Drill sample | <ul style="list-style-type: none"> Method of recording and assessing core | <ul style="list-style-type: none"> A record of qualitative sample |

| Criteria | JORC Code explanation | Commentary |
|--|--|---|
| recovery | <p><i>and chip sample recoveries and results assessed.</i></p> <ul style="list-style-type: none"> • <i>Measures taken to maximise sample recovery and ensure representative nature of the samples.</i> • <i>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</i> | <p>recovery and moisture content was recorded by field assistants under the supervision of the rig geologist.</p> <ul style="list-style-type: none"> • Weight checks were done periodically at the rig. Overall sample weight and quality was good. The rig geologist closely monitored the rig to ensure the entire sample was collected in both bulk plastic & calico bag prior to removal from the cyclone splitter, and action was taken if sample weights showed marked variations. |
| Logging | <ul style="list-style-type: none"> • <i>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</i> • <i>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.</i> • <i>The total length and percentage of the relevant intersections logged.</i> | <ul style="list-style-type: none"> • All RC chips were logged at the drill-rig-site for main/subordinate lithology, colour, grain size, regolith, alteration, oxidation and mineralisation. • Geological logging is both qualitative and quantitative in nature. The lithology, colour, grain size, regolith, alteration, oxidation, veining and mineralisation were recorded. Sulphide and vein content were logged as a percentage of the interval. Representative chips were collected in chip trays for each 4m interval and retained on site (no photographs). • All of the drilling was geologically logged. |
| Sub-sampling techniques and sample preparation | <ul style="list-style-type: none"> • <i>If core, whether cut or sawn and whether quarter, half or all core taken.</i> • <i>If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.</i> • <i>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</i> • <i>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</i> • <i>Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.</i> • <i>Whether sample sizes are appropriate to the grain size of the material being sampled.</i> | <ul style="list-style-type: none"> • The RC samples were sub-sampled using a rig mounted, self-levelling cone splitter. The vast majority of the samples were dry with rare moist and wet samples recorded on the sampling sheet. • The sample preparation followed industry best practice in sample preparation involving oven drying and pulverisation of the entire ~3kg sub-sample using LM5 grinding mills to a grind size of 85% passing less than 75 microns. • Field duplicates were collected and assessed to determine cone splitter repeatability; results showed reasonable repeatability. • Commercially prepared and certified reference materials (standards and blanks) along with field duplicates were inserted at a ratio of 1:20 into the sample string. The QAQC results from this program were considered to be acceptable. • Sample recoveries were recorded by Stone's field staff. Apertures in |

| Criteria | JORC Code explanation | Commentary |
|--|---|---|
| | | <p>the cone splitter were adjusted to maintain a sample weight between 2.5 and 3.5kg. Periodic sample weighing was carried out to ensure an even split between duplicate samples by the cone splitter.</p> <ul style="list-style-type: none"> The sample sizes are considered to be appropriate and to correctly represent mineralisation at the deposit based on the style of mineralisation (lode/ mesothermal gold), the thickness and consistency of the intersections, the sampling methodology and assay ranges returned for gold. |
| <p><i>Quality of assay data and laboratory tests</i></p> | <ul style="list-style-type: none"> <i>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</i> <i>For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</i> <i>Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.</i> | <ul style="list-style-type: none"> A 50g charge for the Fire Assaying was employed. This is considered to be an appropriate sub-sample size for a total determination of gold. No geophysical tools were used to determine any element concentrations. Sample preparation checks for fineness were carried out by the laboratory as part of their internal procedures to ensure the grind size of 85% passing 75 micron was achieved. Laboratory quality control involved the use of certified reference material, blanks, splits and replicates as part of the in house procedures. These results were used along with Stone's quality control data to illustrate that there was no systematic bias and that results had an acceptable level of precision and accuracy. |
| <p><i>Verification of sampling and assaying</i></p> | <ul style="list-style-type: none"> <i>The verification of significant intersections by either independent or alternative company personnel.</i> <i>The use of twinned holes.</i> <i>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</i> <i>Discuss any adjustment to assay data.</i> | <ul style="list-style-type: none"> The Senior Exploration Geologist from Stone has visually verified the significant intersections using material collected in the diamond cores and RC chip trays. There were twinned holes drilled at Ben Hur deposit in 2012; No twinned holes were drilled at the Alpha and Delta deposit; The primary data was collected by using logging software that was installed on a Toughbook™. This software contained standard lookup tables for the logging codes. The collected data was subsequently validated according to Stone's procedures prior to being sent to Kalgoorlie Assay Laboratories. At this point further validations were carried out prior to uploading the |

| Criteria | JORC Code explanation | Commentary |
|--|--|---|
| | | <p>data into a SQL database.</p> <ul style="list-style-type: none"> No adjustments were made to the assay data. |
| <i>Location of data points</i> | <ul style="list-style-type: none"> <i>Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</i> <i>Specification of the grid system used.</i> <i>Quality and adequacy of topographic control.</i> | <ul style="list-style-type: none"> Post drilling a hand-held GPS was used to record the drill hole coordinates. These locations were used by Stone's Mine Surveyors who employed a Real Time Kinematic (RTK) Differential GPS to pick up the collar of the holes. The RTK method provides positional precision up to 10mm. Down-hole surveys were carried out every 30m using a Camteq Electronic Multi-shot camera. Regular re-surveying was carried out to check the quality of readings. All work was carried out in the Geocentric Datum of Australia 1994 (GDA94) within the zone 51 projection. |
| <i>Data spacing and distribution</i> | <ul style="list-style-type: none"> <i>Data spacing for reporting of Exploration Results.</i> <i>Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</i> <i>Whether sample compositing has been applied.</i> | <ul style="list-style-type: none"> This programme of resource definition drilling conducted at the Alpha, Ben Hur and Delta deposits were on an approximate 20m by 20m spacing, along strike and down dip. 20m by 20m spacing at the Alpha, Ben Hur and Delta deposits has been considered sufficient to establish geological and grade continuity according to the Australian JORC 2012 code; This code has been used as a reference on reporting results to the ASX and the public. No compositing has been applied to the exploration samples. |
| <i>Orientation of data in relation to geological structure</i> | <ul style="list-style-type: none"> <i>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</i> <i>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</i> | <ul style="list-style-type: none"> Pit mapping and structural measurements have been taken at the deposits and they confirm the orientation of mineralisation defined by the drilling. Based upon the above information the drilling for both programs has been largely perpendicular to the mineralisation with some minor exceptions due to constraints enforced by mining activities and infrastructure. No significant orientation bias has been identified in the data at this point. |
| <i>Sample security</i> | <ul style="list-style-type: none"> <i>The measures taken to ensure sample security.</i> | <ul style="list-style-type: none"> Once the samples had been collected and checked by the field staff they were placed into polyweave bags. These samples were then taken to a secure |

| Criteria | JORC Code explanation | Commentary |
|---------------------------------|--|---|
| | | <p>laydown area at the Alpha, Delta mine site. Toll Priority transported the samples to Perth to the assay laboratory who stored them in a locked yard. A series of well tested digital and paper tracking mechanisms were used by Stone to track the progress of the sample batches.</p> |
| <p><i>Audits or reviews</i></p> | <ul style="list-style-type: none"> <i>The results of any audits or reviews of sampling techniques and data.</i> | <ul style="list-style-type: none"> An external review was carried out by CSA in July 2012. The sampling techniques and quality of samples were found to be satisfactory. |

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

| Criteria | JORC Code explanation | Commentary |
|--|--|--|
| <i>Mineral tenement and land tenure status</i> | <ul style="list-style-type: none"> • <i>Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.</i> • <i>The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</i> | <ul style="list-style-type: none"> • The Alpha deposit is located in M38/1058, M38/1056, M38/1057, M38/968, and P38/3834 mining licences. • The Ben Hur deposit is located in M38/339 mining licences. • The Delta deposit is located in M38/346 mining licences. • Stone Gold Mining Limited has a 100% interest in these tenements. • The tenements are in good standing with no known impediments. |
| <i>Exploration done by other parties</i> | <ul style="list-style-type: none"> • <i>Acknowledgment and appraisal of exploration by other parties.</i> | <ul style="list-style-type: none"> • Exploration by other parties has been reviewed and taken into account when exploring. Previous parties conducted rock chip sampling, mapping and drilling. This report only concerns exploration results collected by Stone. |
| <i>Geology</i> | <ul style="list-style-type: none"> • <i>Deposit type, geological setting and style of mineralisation.</i> | <ul style="list-style-type: none"> • Gold mineralisation is both structurally and lithologically controlled and occurs in a series of stepped lodes. • The mineralized zone at Alpha is based on a single, shear hosted lode. The lode is shallow north dipping within the oxide position and steepens to around 50° to 60° in fresh rock. The shear geometry plunges around 10° to 150° to the northwest (300°). • The main mineralised zone at Ben Hur is contained within a vertical to steeply east dipping, sheared quartz dolerite unit which is 40m to 50m thick and strikes north northwest over the length of the lease. • The mineralization in Delta deposit is associated with steep east dipping sedimentary units, in particular the chert horizon located on the footwall of the sediment sequence. |
| <i>Drill hole Information</i> | <ul style="list-style-type: none"> • <i>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:</i> <ul style="list-style-type: none"> ○ <i>easting and northing of the drill hole collar</i> ○ <i>elevation or RL (Reduced Level – elevation above sea level in metres) of</i> | <ul style="list-style-type: none"> • Refer to Tables 1 & 2 and Section 1. |

| Criteria | JORC Code explanation | Commentary |
|---|--|--|
| | <p><i>the drill hole collar</i></p> <ul style="list-style-type: none"> ○ <i>dip and azimuth of the hole</i> ○ <i>down hole length and interception depth</i> ○ <i>hole length.</i> <ul style="list-style-type: none"> • <i>If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.</i> | |
| <i>Data aggregation methods</i> | <ul style="list-style-type: none"> • <i>In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.</i> • <i>Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.</i> • <i>The assumptions used for any reporting of metal equivalent values should be clearly stated.</i> | <ul style="list-style-type: none"> • All of the reported intersections have a lower cut-off of 0.5g/t with a maximum internal dilution of two consecutive samples. No top-cuts were applied. Individual 1m results >1 g/t Au are also included. • Higher grade (generally >5g/t) intervals within results were reported alongside the overall intersection, where a substantial proportion of the total gold in an intersection was contained within the high-grade sub-interval(s) or grades were materially higher than adjacent assays. For example, in a run of 1-2 g/t results, assays over 5.0 g/t Au would be reported as a sub-interval; in a run of 2-6 g/t assays, results >10 g/t Au would be reported as a sub-interval. In these instances generally a maximum internal dilution of two consecutive samples was used. No top cuts were applied. • No metal equivalents were used. |
| <i>Relationship between mineralisation widths and intercept lengths</i> | <ul style="list-style-type: none"> • <i>These relationships are particularly important in the reporting of Exploration Results.</i> • <i>If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.</i> • <i>If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').</i> | <ul style="list-style-type: none"> • The main zone of mineralisation at the Alpha, Ben Hur and Delta deposits are broadly 310°-trending structure that dips approximately 65° to the south-west. Slightly obliquely striking mineralisation is most strongly formed in the footwall but also exists in the hangingwall to the main zone. • Drill holes, where possible were designed to be perpendicular to the lodes, however, in some cases local infrastructure inhibited this. • All of the intersections are given in down hole metre lengths. |
| <i>Diagrams</i> | <ul style="list-style-type: none"> • <i>Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</i> | <ul style="list-style-type: none"> • Refer to previous announcements |

| Criteria | JORC Code explanation | Commentary |
|---|---|---|
| <i>Balanced reporting</i> | <ul style="list-style-type: none"> Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results. | <ul style="list-style-type: none"> All results were reported for the entire drill programs. |
| <i>Other substantive exploration data</i> | <ul style="list-style-type: none"> Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances. | <ul style="list-style-type: none"> No other exploration data that has been collected is considered to be meaningful or material to this announcement. |
| <i>Further work</i> | <ul style="list-style-type: none"> The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling). Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive. | <ul style="list-style-type: none"> Currently, over 4,000m further Phase II resource definition diamond and RC drilling is planned for the Ben Hur deposit. Follow up drilling is currently being finalised so is not shown. |

Section 3 Estimation and Reporting of Mineral Resources

(Criteria listed in section 1, and where relevant in section 2, also apply to this section.)

| Criteria | JORC Code explanation | Commentary |
|----------------------------------|--|--|
| <i>Database integrity</i> | <ul style="list-style-type: none"> Measures taken to ensure that data has not been corrupted by, for example, transcription or keying errors, between its initial collection and its use for Mineral Resource estimation purposes. Data validation procedures used. | <ul style="list-style-type: none"> The database is maintained by site personnel. The exploration database used for the resource estimation has been validated and considered accurate. |
| <i>Site visits</i> | <ul style="list-style-type: none"> Comment on any site visits undertaken by the Competent Person and the outcome of those visits. If no site visits have been undertaken indicate why this is the case. | <ul style="list-style-type: none"> The Competent Person for this update is a full time employee of CSA Global and undertakes regular site visits ensuring industry standards of the Mineral Resource estimation process from sampling through to final block model. |
| <i>Geological interpretation</i> | <ul style="list-style-type: none"> Confidence in (or conversely, the uncertainty of) the geological interpretation of the mineral deposit. Nature of the data used and of any assumptions made. The effect, if any, of alternative interpretations on Mineral Resource estimation. The use of geology in guiding and controlling Mineral Resource estimation. The factors affecting continuity both of grade and geology. | <ul style="list-style-type: none"> Geological and mineralisation interpretations were reviewed by CSA geologist. The wireframes were generated based on cross sections widths of 20m – 20m spacing. This was based on exploration and grade control drilling patterns. Mineralisation cut-off grades of 0.3g/t Au combined with the geological logging were used to define the mineralised envelopes. The geological interpretation of mineralised boundaries is considered robust and alternative interpretations do not have the potential to impact significantly on the Mineral Resources. |
| <i>Dimensions</i> | <ul style="list-style-type: none"> The extent and variability of the Mineral Resource expressed as length (along strike or otherwise), plan width, and depth below surface to the upper and lower limits of the Mineral Resource. | <ul style="list-style-type: none"> The Alpha deposit mineralisation extends from 472,000mE to 473,500mE, 6,822,460mN to 6,823,200mN, and 30m below surface. The deposit with multiple lodes generally strikes towards NW with a strike length of approximately 1,500m, dipping towards the northeast at 30° -45° with and having a vertical extent of about 100m. The Ben Hur deposit mineralisation extends from 437,000mE to 438,000mE, 6,883,500mN to 6,885,600mN, and 30m below surface. The deposit with multiple lodes generally strikes towards NW with a strike length of approximately 2,000m, dipping towards the northeast at 70° -80° with and having a vertical extent of |

| Criteria | JORC Code explanation | Commentary |
|---|---|--|
| | | <p>about 120m.</p> <ul style="list-style-type: none"> The Delta deposit mineralisation extends from 441,000mE to 442,000mE, 6,865,000mN to 6,867,500mN, and 30m below surface. The deposit with multiple lodes generally strikes towards NW with a strike length of approximately 2,000m, dipping towards the northeast at 70° - 80° with and having a vertical extent of about 100m. |
| <p><i>Estimation and modelling techniques</i></p> | <ul style="list-style-type: none"> <i>The nature and appropriateness of the estimation technique(s) applied and key assumptions, including treatment of extreme grade values, domaining, interpolation parameters and maximum distance of extrapolation from data points. If a computer assisted estimation method was chosen include a description of computer software and parameters used.</i> <i>The availability of check estimates, previous estimates and/or mine production records and whether the Mineral Resource estimate takes appropriate account of such data.</i> <i>The assumptions made regarding recovery of by-products.</i> <i>Estimation of deleterious elements or other non-grade variables of economic significance (eg sulphur for acid mine drainage characterisation).</i> <i>In the case of block model interpolation, the block size in relation to the average sample spacing and the search employed.</i> <i>Any assumptions behind modelling of selective mining units.</i> <i>Any assumptions about correlation between variables.</i> <i>Description of how the geological interpretation was used to control the resource estimates.</i> <i>Discussion of basis for using or not using grade cutting or capping.</i> <i>The process of validation, the checking process used, the comparison of model data to drill hole data, and use of reconciliation data if available.</i> | <ul style="list-style-type: none"> 1m composites was created and used for the statistical, variography analyses and estimation. Thorough univariate statistical analysis of density weighted, 1m, mineralogy flagged, downhole composites has been completed for gold and for all lodes and top-cuts established where applicable. Statistical analysis indicated that outlier management was crucial to prevent severe high grade smearing that could result in potential overestimation for some elements. The approach used has been capping (Top-cuts were defined by domain following thorough examinations of histograms, probability curves and the spatial locations of the outliers). Top cuts ranged from 5g/t to 100g/t based on analysis of individual lodes statistics. Variogram modelling completed within Isatis™ software and used to define the characterization of the spatial continuity of gold within all lodes and parameters used for the interpolation process. Variogram model are cross-validated to ensure parameters are accurate. Quantitative Kriging Neighbourhood analysis (QKNA) using goodness of fit statistics to optimize estimation parameters has been undertaken. Parameters optimised include block size, search parameters, number of samples (minimum and maximum) and block discretization. Directional ranges have been determined from variogram modelling and are used to constrain the search distances used in block |

| Criteria | JORC Code explanation | Commentary |
|----------|-----------------------|--|
| | | <p>interpolation, incorporating geologists' interpretation of ore geometry and continuity. Estimation search strategies implemented have sought to ensure robust estimates while minimising conditional bias. Three search estimation runs are used with initial short-search runs extending the sample influence in later runs.</p> <ul style="list-style-type: none"> • Block estimation has been completed within Datamine™ Studio 3 Resource Modelling software. Three dimensional mineralisation wireframes were completed within Micromine™ software and imported into Datamine™. These wireframes are used as hard boundaries for the interpolation. • Ordinary Kriging using a local dynamic anisotropy search is used for block grade estimates using uniquely coded 1m composite data for respective lodes. • All block estimates are based on interpolation into parent blocks. Parent block estimates are then assigned to sub-blocks. Mineral Resource estimation does not include any form of dilution. • Block model extends from local grid 4,780mE to 5,400mE, 10,800mN to 12,700mN and vertical from 800mRL to 1,400mRL. • Only gold was estimated. • No selective mining units were assumed in this estimate. • Standard model validation has been completed using visual and numerical methods and formal peer review sessions by key geology staff. • Mineral Resource Model has been validated visually against the input composite/raw drillhole data with sufficient spot checks carried out on a number of block estimates on sections and plans. • Easting, northing and elevation swath plots have been generated to check input composited assay means for block estimates within swath windows. • A comparison of block volume weighted mean versus the drillhole cell de-clustered mean grade of the |

| <i>Bulk density</i> | <ul style="list-style-type: none"> • <i>Whether assumed or determined. If assumed, the basis for the assumptions. If determined, the method used, whether wet or dry, the frequency of the measurements, the nature, size and representativeness of the samples.</i> • <i>The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs, porosity, etc), moisture and differences between rock and alteration zones within the deposit.</i> • <i>Discuss assumptions for bulk density estimates used in the evaluation process of the different materials.</i> | <ul style="list-style-type: none"> • Most dry bulk density determinations have come from samples of the diamond drill holes over a range of RL's. • They have been determined using industry standard methods of dried/sealed weight of core or rock sample in water versus the dry weight in air. • |
| <i>Classification</i> | <ul style="list-style-type: none"> • <i>The basis for the classification of the Mineral Resources into varying confidence categories.</i> • <i>Whether appropriate account has been taken of all relevant factors (ie relative confidence in tonnage/grade estimations, reliability of input data, confidence in continuity of geology and metal values, quality, quantity and distribution of the data).</i> • <i>Whether the result appropriately reflects the Competent Person's view of the deposit.</i> | <ul style="list-style-type: none"> • The Alpha, Ben Hur and Delta Mineral Resources have been classified and reported in accordance with The Australasian Code for Reporting of Mineral Resources and Ore Reserves (JORC Code 2012 Version). Resource classification is based on confidence in the geological domaining, drill spacing and geostatistical measures. • The initial classification process was based on an interpolation distance and minimum samples within the search ellipse. The main components are summarised as follows: <ul style="list-style-type: none"> • Initial classification: <ul style="list-style-type: none"> - The resource was classed as Inferred if the average weighted sample distance was greater than 50 m. - The resource was classed as Indicated if the average weighted sample distance was between 25 m and 50 m. - Numbers of drill holes < 2 Indicated and Inferred resources downgraded one class. • The initial classification was reviewed visually. Based on the initial classification, three solids rescat_ind and rescat_inf were created to define Measured, Indicated and Inferred resources. This defined resource categories based on a combination of data density and geological confidence. • |
| <i>Audits or reviews</i> | <ul style="list-style-type: none"> • <i>The results of any audits or reviews of Mineral Resource estimates.</i> | <ul style="list-style-type: none"> • The Mineral Resource and estimation procedures prepared by SKR have been reviewed by CSA. • The process for geological modelling, estimation and reporting of Mineral Resources has been |

|--|--|---|
| | | <p>subject to an independent, external review by CSA. CSA undertook a peer review during 5th – 6th January 2014 and found the process to be industry standard with minor recommendations as part of continuous improvement.</p> |
| <p><i>Discussion of relative accuracy/confidence</i></p> | <ul style="list-style-type: none"> • <i>Where appropriate a statement of the relative accuracy and confidence level in the Mineral Resource estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the resource within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors that could affect the relative accuracy and confidence of the estimate.</i> • <i>The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.</i> • <i>These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.</i> | <ul style="list-style-type: none"> • The Mineral Resources have been reported in accordance with the guidelines of the 2012 edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves and reflects the relative accuracy of the Mineral Resources estimates. • The current Mineral Resource model represents a robust global estimate of the remaining, in-situ gold mineralisation for the Alpha, Ben Hur and Delta deposits. • Existing operating reports of achieved production verse estimate is positive. • It is recommended to use optimised pit shells as a guide to create drilling programmes that maximise the conversion from lower category resources (Inferred to Indicated) and reduces mining risk attributed to data density and quality. Careful consideration of mining dilution is warranted given the tenor, style and orientation of the mineralised lodes. |

Section 4 Estimation and Reporting of Ore Reserves - –Not Applicable

(Criteria listed in section 1, and where relevant in sections 2 and 3, also apply to this section.)
