First core drill hole to commence at Tamboli Project

The Board of Western Mining Network Ltd (“WMN” or the “Company”) is pleased to announce the arrival of the drilling equipment and crew on site at the Tamboli Project in Sulawesi. Core drilling of DH-MS-001 to 50m targeting a geophysical Resistivity and IP anomaly will commence shortly (Figure 1). Exploration has identified slate with visible graphite which has distinct geophysical chargeability/conductivity anomalies associated with a zone where diorite intrudes metamorphosed sediments.

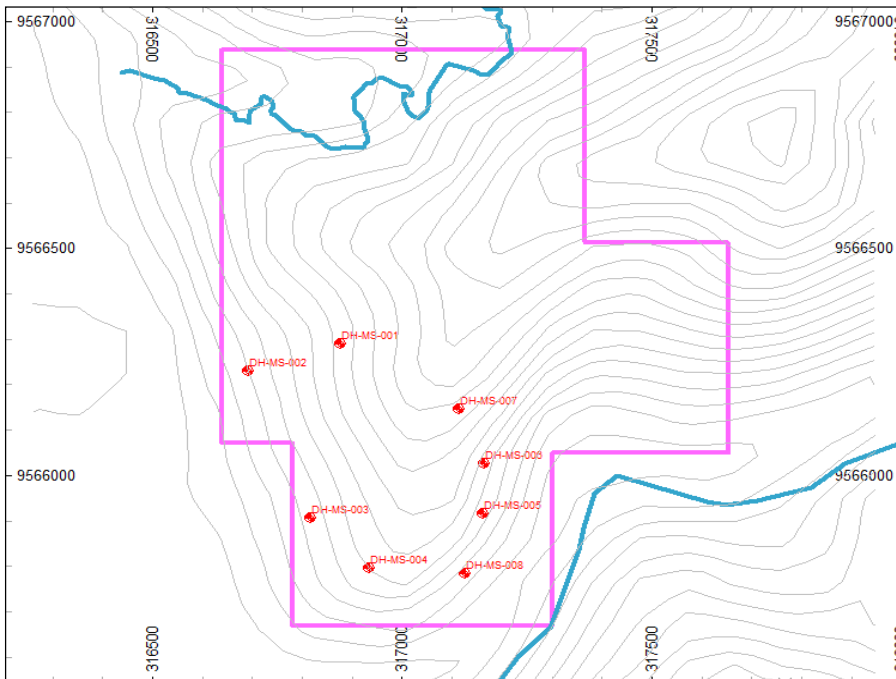

Figure 1: Proposed core drill holes at Tamboli Project

Should drilling be successful, PT Eagle Rich Nusantara plans to own an industrial estate and graphite beneficiation plant, which will be constructed in the immediate area.

WMN is continuing its due diligence on the Tamboli Project including legal and corporate due diligence simultaneously with the technical work. The acquisition of the Tamboli Project remains subject to ASX and any other regulatory approvals.
